ABSTRAK

Angka Kematian Ibu (AKI) dan Angka Kematian Bayi (AKB) merupakan indikator utama derajat kesehatan suatu Negara yang mengindikasikan mutu pelayanan kesehatan ibu dan anak. Laporan ini bertujuan memberikan asuhan pada ibu hamil, bersalin, nifas dan KB serta neonatus. Pengambilan kasus dilaksanakan di PMB Rosita, STr. Keb pada bulan Desember 2020 sampai Februari 2021. ANC pada Ny.M G₁ P₀ A₀ H₀ dilakukan kunjungan 3 kali pada usia kehamilan 36, 37 dan 38 minggu 6 hari. Asuhan dilakukan dengan cara mendampingi ibu periksa kehamilan ke PMB. Kehamilan Ny.M mengalami masalah yaitu anemia ringan, nyeri pinggang dan kontraksi palsu, hal ini dapat di atasi dengan memberikan asuhan dan pendidikan kesehatan yang berkelanjutan. Adanya KPD pada saat INC dengan persalinan yang berlangsung secara normal. PNC dilakukan 4 kali kunjungan rumah, putting payudara sebelah kanan kurang menonjol, ASI sedikit sehingga bayi sulit menghisap, asuhan yang dilakukan dengan cara inverted nipple, brace pump, pijat oksitosin, mobilisasi dini, dan perawatan luka perineum. Ibu memilih KB suntik 3 bulan. Asuhan neonatus dilakukan kunjungan 4 kali, kesulitan menghisap karena putting payudara kurang menonjol dan memberikan asuhan untuk mengatasinya. Diharapkan bidan meningkatkan pelayanan komprehensif sesuai dengan standar kebidanan dimulai dari masa kehamilan, persalinan, nifas, neonatus dan KB.

ABSTRACT

Maternal Mortality Rate (MMR) and Infant Mortality Rate (IMR) are the main indicators of a country's health status that indicate the quality of maternal and child health services. This report aims to provide care for pregnant women, maternity, postpartum and family planning and neonates. Case collection was carried out at PMB Rosita, STr. Keb in December 2020 to February 2021. ANC for Mrs. M G1 P0 A0 H0 was visited 3 times at 36, 37 and 38 weeks of 6 days of gestation. The care is carried out by accompanying the mother to check her pregnancy at PMB. Mrs. M's pregnancy experienced problems, namely mild anemia, low back pain and false contractions, this can be overcome by providing continuous health care and education. The presence of PROM at the time of INC with a normal delivery. PNC was carried out 4 home visits, the nipple on the right side was less prominent, breast milk was low so it was difficult for the baby to suck, the care was carried out by means of an inverted nipple, brace pump, oxytocin massage, early mobilization, and perineal wound care. Mother chose 3-month injection KB. Neonatal care was visited 4 times, had difficulty sucking because the nipples were less prominent and provided care to overcome them. It is expected that midwives will improve comprehensive services in accordance with midwifery standards starting from the period of pregnancy, childbirth, postpartum, neonates and family planning.
