HUBUNGAN PENGETAHUAN IBU TERHADAP IMUNISASI
DASAR LENGKAP PADA BAYI DIWILAYAH KERJA
PUSKESMAS PULAU MERBAU TAHUN 2022

xi + 32 halaman + 3 tabel + 2 bagan + 12 lampiran

ABSTRAK

Pengetahuan tentang imunisasi sangat penting bagi ibu, terutama bagi ibu yang baru saja melahirkan bayinya. Imunisasi merupakan pemberian vaksin pada balita agar imunisasi tubuh balita dapat meningkat dan kebal terhadap penyakit. Penelitian ini bertujuan untuk mengetahui hubungan pengetahuan ibu terhadap imunisasi dasar lengkap pada bayi di wilayah Kerja Puskesmas Pulau Merbau Tahun 2022. Jenis penelitian *kuantitatif* dengan desain *deskriptif*. Jumlah sampel 82 orang ibu dengan teknik pengambilan sampel *purposive sampling*. Instrumen penelitian ini menggunakan kuesioner, dengan pengumpulan menggunakan data primer. Analisa data menggunakan univariate dan bivariat. Hasil didapat mayoritas responden dalam kategori pengetahuan kurang sebanyak 53,6% dan tidak mendapatkan imunisasi dasar lengkap sebanyak 59,8%. Hasil uji *chi square* terdapat hubungan pengetahuan ibu tentang pemberian imunisasi dasar lengkap terhadap kelengkapan imunisasi dasar pada bayi di wilayah Kerja Puskesmas Pulau Merbau. Diharapkan hasil penelitian ini dapat menjadi sumber referensi perbaikan program dalam meningkatkan program imunisasi dasar lengkap, yaitu dengan memberikan informasi dan penyuluhan kepada masyarakat tentang pentingnya pemberian imunisasi dasar lengkap.

ABSTRACT

Knowledge about immunization is very important for mothers, especially for mothers who have just given birth to their babies. Immunization is giving vaccines to toddlers so that toddlers' body immunizations can increase and become immune to disease. This study aims to determine the relationship between maternal knowledge and complete basic immunization for infants in the Merbau Island Health Center in 2022. This type of research is quantitative with a descriptive design. The number of samples was 82 mothers with purposive sampling technique. Data analysis using univariate and bivariate. The results obtained that the majority of respondents in the category of lack of knowledge were 53.6% and did not get complete basic immunization as much as 59.8%. The results of the chi square test showed that there was a relationship between mother's knowledge about the provision of complete basic immunization and the completeness of basic immunization for infants in the Merbau Island Health Center Work area. It is hoped that the results of this study can be a source of reference for program improvements in increasing the complete basic immunization program, namely by providing information and counseling to the public about the importance of providing complete basic immunization.

Keywords: Knowledge, Complete Basic Immunization
