ABSTRAK

Bounding Attachment merupakan dasar terbentuknya hubungan yang sehat bagi bayi dalam kehidupan selanjutnya. Berdasarkan hasil survey awal yang dilakukan peneliti di wilayah kerja UPT Puskesmas Pulau Merbau, diperoleh data 80% tidak mengetahui tentang *Bounding Attachment* antara ibu dan bayi. Penelitian ini bertujuan untuk mengetahui faktor-faktor yang berhubungan dengan pengetahuan ibu nifas tentang *Bounding Attachment* di wilayah kerja UPT Puskesmas Pulau Merbau Kabupaten Kepulauan Meranti. Penelitian ini dilakukan dari bulan januari sampai april 2022. Jenis penelitian kuantitatif dengan desain *cross sectional*. Jumlah sampel 31 orang ibu nifas dengan teknik pengambilan sampel *total sampling*. Analisa data menggunakan uji *chi-square* pada tingkat kepuasan 95%.. Hasil penelitian 51,6% ibu nifas dalam kelompok umur dewasa, 54,8% pendidikan rendah, dan 87,1% tidak bekerja serta 77,4% memiliki pengrtahuan cukup dan kurang tentang *Bounding Attachment*. Hasil uji statistik didapatkan tidak ada hubungan umur (1.000), pendidikan (0.198), dan pekerjaan (0.212) dengan pengetahuan ibu nifas tentang *Bounding Attachment*. Disarankan tenaga kesehatan wilayah kerja UPT Puskesmas Pulau Merbau Kabupaten Kepulauan Meranti meningkatkan KIE tentang *Bounding Attachment* khususnya dalam pelayanan nifas dan memperluas akses/jangkauan informasi dengan memberikan *leaflet*, poster atau lembar balik kepada masyarakat.

ABSTRACT

Bounding Attachment is the basis for the formation of a healthy relationship for the baby in the next life. Based on the results of the initial survey conducted by researchers in the working area of the Merbau Island Health Center UPT, 80% of the data were obtained who did not know about the Bounding Attachment between mother and baby. This study aims to determine the factors associated with postpartum mother's knowledge about Bounding Attachment in the working area of the UPT PuskesmasPulauMerbau, Meranti Islands Regency. This research was conducted from January to April 2022. This type of research is quantitative with a cross sectional design. The number of samples was 31 postpartum mothers with total sampling technique. Data analysis used chi-square test at 95% satisfaction level. The results of the study were 51.6% of postpartum mothers in the adult age group, 54.8% had low education, and 87.1% did not work and 77.4% had sufficient knowledge and less about Bounding Attachments. The results of statistical tests showed that there was no relationship between age (1,000), education (0.198), and occupation (0.212) with postpartum mother's knowledge of Bounding Attachment. It is recommended that health workers in the working area of UPT PuskesmasPulauMerbau, Meranti Islands Regency improve KIE on Bounding Attachments, especially in postpartum services and expand access/reach of information by providing leaflets, posters or flipcharts to the community.
