Diabetes mellitus is a chronic disease that occurs when the pancreas does not produce enough insulin or when the body cannot effectively use the insulin it produces. Insulin is a hormone that regulates blood glucose. While hyperglycemia is a condition in which there is an increase in blood glucose or an increase in blood sugar, the general effects of uncontrolled diabetes cause serious damage to many body systems, especially nerves and blood vessels that can cause damage to the integrity of the skin. The purpose of this study was able to describe Nursing Care in Type II DM Patients with Nursing Problems skin integrity disorders at the Sail Health Center. The research method used is in the form of a case study descriptive and will be carried out on May 10-12, 2023. From the results of studies on subjects 1 and subject 2 with diagnosis DM Type II with nursing problems, skin integrity disorders are associated with blood glucose instability. After 3 x 24 hours of nursing care, wound care management was found to have dried up and the wound healing process improved.
