**COMPREHENSIVE MIDWIFERY CARE TO MOM “W” AT PRATAMA
BAKTI CLINIC PEKANBARU CITY**

Xi + 115 PAGES + 8 TABLES+ 25 ATTACHMENTS

ABSTRACT

The role of the midwife is needed in reducing the morbidity and mortality rates of mothers and neonates by providing on going and continuous care or better known as *Continuity of Midwifery Care (CoMC)*. Midwifery care is done to Mom. "W" G2P0A1H0 at Pratama Bakti Clinic Pekanbaru city from November to December 2019. Starting from the age of 36 weeks gestation to postpartum 30 days with 3 times pregnant visits, 1 delivery, and postpartum and neonates 3 visits. During pregnancy Mom "W" experiences discomfort that is back and waist pain. This was resolved after being given health education and pregnancy exercises. Deliverybirth Mom "W" with Normal deliverybirth Care a baby born to a woman with 3000 grams body weight and IMD is successful. The postpartum period P1A1H1 complains that breast milk is not smooth and painful on the perineal wound. This was resolved after being given health education and oxytocin massage and puerperal exercises. Neonates experience jaundice and there is a decrease in body weight on the 4th day neonate of 6.7%. This can be overcome by providing maternal health education to breastfeed the baby as often as possible and after a baby massage for 15 days the baby's weight has increased by 25%. Hopefully midwives can provide comprehensive care during pregnancy, childbirth, childbirth and neonates in according to care in midwifery services
